You can add layers by clicking on the icon, or you can select an object to create a new layer. When you have a number of active layers, Photoshop creates the background image in the document's Layers panel. (You can add an additional background layer by either selecting the background layer in the Layers panel or by right-clicking in an empty area of the document and choosing New Layer from the context menu.) You can edit an active layer by clicking on the color box near the layer's name in the Layers panel. Clicking on the color box allows you to edit the entire layer or parts of it. You can move, resize, or rotate an object by dragging it in the Layers panel. Resizing a layer acts as if you shrunk the image. A second icon, named Layer Mask, allows you to define one or more parts of the layer to mask off while leaving the rest of the layer unaffected. Masks can be either Invert, that inverses the color values of the layer; Dithered, that creates a blurred effect; or Dark, that darkens pixels. Close Figure 2. The Layers panel allows you to move, resize, and rotate layers. You can select individual layers by clicking on the name in the panel's bottom-right or left-right corner (Figure 3). You can then use the Edit or Move tools to edit, delete, or rearrange the selected layers in the Layers panel, as well as change their opacity. Figure 3. When selected, individual layers can be edited with the Move, Edit, and Delete tools, with the Layers panel showing all the layers in the document. Save and Close Figure 4. The Layers panel allows you to create and edit various layers. Photoshop offers two Save modes: Application and Layer. The Application save mode creates an image that is an exact replica of the layers in your document. You can then share the document (including its layers) with others or save it on a thumb drive or other storage medium. In a Layer save mode, you can save the image as a collection of layers in a new file, retaining the properties of the original layer, or you can save the image as

While testing I found that all the gtk programs like gimp, file-chooser, etc were not starting in daemon mode. But the command line utility tests like `convert` and `text2pixbuf` are working fine as they are always running in daemon mode. I googled and I found `g_main_context_iteration()` is initialised in the `main()` function of `gtk` main loop and the default value is `G_MAIN_CONTEXT_INIT`. So is there any way I can use this to launch the program in daemon mode? I was able to launch the same program in daemon mode by using `CreateProcess` API and `process`. But using `gtk` I cant find a way to do the same. Is there any way to do it in `gtk`? Or I have to make my own solution using this API. A: It's in `g_main_context_iteration`, but it's not
