Tapping and dimpling are 2 manifestations of a process called fibrofatty degeneration. This process most commonly occurs in older women and involves breakdown and atrophy of skin collagen. Tapping is caused by an acute process of tearing in the dermis. Dimpling results from rupture of collagen fibers and their replacement by fibrofatty tissue and subsequent fibrosis. This process can be considered a type of myofibroplasia or scarring. These changes may persist for many years, making it particularly difficult to determine the precise cause of the condition. Treatment is largely supportive, and the prognosis is variable. This paper describes the clinical features of a patient with dimpling on her legs and arms who was referred to our clinic by a dermatologist, her family physician.⁹) a multi-crore damage notice to Facebook for alleged copyright violation of a popular Tamil movie ?
