Sep 23, 2015 Uninstall primocache or re-download latest version. Windows 7 OS bit. Anaerobic co-digestion of swine manure, oil palm fronds and rice husks using MSWI biogas and process. This study evaluated the performance of anaerobic co-digestion of swine manure (SM), oil palm fronds (OPF), and rice husks (RH) at mesophilic temperature (30 °C) with MSWI biogas. Methane yield of co-digestion was higher than that of mono-digestion of SM and mono-digestion of OPF and RH, respectively. The highest methane yield at the end of anaerobic co-digestion of SM, OPF and RH was 69.0 mL CH₄/g VS. When the ratios of input were 1:1.5:3.0 (kg/kg) in SM:OPF:RH, respectively, the highest biogas yield was obtained at the ratio of 1:1:1.5 (kg/kg) which is 3.6-fold of the value for mono-digestion of SM. The highest substrate degradation rate was obtained at the ratio of 1:1:3.0 which was similar to that of mono-digestion of OPF. Efficacy and safety of hydroxyethyl starch administration in trauma patients with multiple trauma: a double-blind randomized trial. To evaluate the efficacy and safety of hydroxyethyl starch (HES) use in multiple trauma patients in a double-blind randomized trial. This study was conducted at a level 1 university trauma center from April 2011 to June 2013. A total of 115 patients with multiple trauma were prospectively included in the study. Patients were randomized to receive either 6% HES (n = 58) or 6% normal saline (n = 57) during their 24-h stay at the emergency department. The primary endpoint was to evaluate the efficacy and safety of a single dose of 6% HES. The secondary endpoint was to compare survival rates between HES and normal saline groups. Patients in the HES and control groups demonstrated statistically significant lower fluid and blood transfusion requirements than the previous study. The 6% HES group showed lower systolic blood pressure and heart rate in the first 6 h of the intervention than the control group. After 24 h, the systolic blood pressure and heart rate remained
