RainCycle, Water Harvesting Systems Analysis and Optionally Optimization for Storage Tanks and Rainwater Harvesting Systems. Developed as a decision-making assistant, RainCycle is a Microsoft Excel spreadsheet that focuses on the hydraulic simulation of Rainwater Harvesting Systems (RWH), such as the costs of construction, operation, maintenance, and decommissioning. It covers residential, industrial, commercial and public buildings. The downloaded package includes the standard and advanced version of RainCycle, in addition to in-depth help documentation and tutorials (for a junior school. These Excel spreadsheets can be copied to your computer and used as templates when designing your own hydraulic simulation systems. Just make sure to keep the original files untouched by saving your own models as new files or by creating backups. RainCycle features optimization programs for storage tank sizes and cost savings, as well as a simulation for the harvesting system (up to 100 years, including yearly expenses and detailed results). It can take into consideration all costs, automatically generate reports, check for errors, and use any currency you define. The hydraulic modules cover rainfall profiles, catchment surface, rainwater filter, storage tank, pump, UV unit and water demand, while the analysis modules are available for project and whole life cost details, tank size, saving and other optimization modes, along with system, sensitivity and Monte Carlo simulation analysis. Based on the Hydrologic Simulation Program Fortran (HSPF) model, a simulation model which has been used in the European Union (EU) for many years, it also includes some extra modules for specific needs. RainCycle can be downloaded for free in the form of an Excel template. It includes a tutorial and detailed manual for in-depth usage and a tutorial for beginners. RainCycle Technology Description: It is designed to be used as a decision-making assistant to be used in hydraulic simulation systems that involve Rainwater Harvesting (RWH), and even as a template to be used when designing your own systems. RainCycle helps you to clearly define variables and parameters needed for your simulation, from the size of your tank to the cost saving calculations. It also features an automatic estimation of the tank size needed to cover a defined consumption profile. This tank size is based on a hydraulic model that estimates the maximum yearly inflow rate and a storage tank that is large enough to cover the minimum yearly inflow and the maximum usage. RainCycle is an easy and intuitive tool to design and simulate your own hydraulic systems. It uses the HSPF hydraulic model, which is considered to be the standard model in the EU. It is therefore widely applicable and can be used for projects in all countries where HSPF is the standard model. It can take into consideration all costs related to the water management system and even more advanced, by using a Monte Carlo analysis module. More information on the hydraulic model can be found on the RainCycle webpage. RainCycle Tool Description: Produced by a private company, RainCycle allows you to obtain a simulation model with which to analyze your project. You can either download the model template, or go to the official website to download the customization options and usage instructions. The free file can be installed on both Windows and Mac OS computers. It contains a series of spreadsheets that you can duplicate and edit to suit your own usage. The model can be loaded with all sorts of parameters, including the tank size, annual rainfall amount, consumption profile (sizes and frequency), and cost saving parameters. A parameter to note is that the model is based on the user-defined currency. You can choose between Euros, US Dollars, Euros per Euro, or other currencies. The software is a valuable tool for monitoring your projects and generates a lot of useful results. The files can be modified and saved as needed, with the required parameters,
