I have the following case:

```
public class FxApi { public FxApi(string input, string output) { var inputList = input.Split('-'); var input = inputList[0]; var outputList = inputList[1].Split('-'); var output = outputList[0]; } }
```

 I'm trying to move the creation of the output array away from the constructor, and towards another line. How do I rewrite this? A: You can just initialize it within the body of the constructor:

```
public class FxApi { private string input; private string output; public FxApi(string input, string output) { this.input = input; this.output = output; } }
```

 Note that you need to make your parameter string be read-only. The easiest way to do that is to use the read ca3bfb1094
