The protagonist, Samuel Rodriguez wakes up and finds himself in an unfamiliar location. He will revisit and attempt to escape from locations connected to his past and along the way uncover the mysteries behind his forgotten past. "I regained consciousness in what seemed to be some kind of detention facility. With a lot of difficulty, I made it out of the hall only to appear in my own home, the home I shared together with Jess. She spoke to me in such a way that she didn't know about the strange situation I was finding myself in. She spoke to me so ordinarily as if everything was alright. No, something about it was a little off. She told me not to follow her but even as I tried, I found myself between two high-rise buildings with a narrow bridge connecting the two. Fear suddenly gripped me. Not because I found myself having to cross a tightrope between two buildings. But it was an ominous feeling that I might lose her. Finally, at the end of a dark hallway, I see my wife once again. What's the dreaded meaning of this game of hide and seek? And what are these absurd locations and experiences? These things that I seeing and hearing, Is it reality or just a dream? I have to figure out what's going on." Gameplay: Trespass – Episode 2 is a game intended to test your cognitive abilities. Escape from various locations, all of which have unique objectives whether it's searching for hints in a morgue through interacting with the surrounding objects or making your way through a military facility using various weapons and explosives. Everything you need to escape is there. It's all a matter of using your observational skills and thinking outside of the box. What's new:

(the technical name for physical smelting[citation needed]) is a large industrial process for extracting copper and other metals from mineral ores, and it occurs naturally in small-scale quantities in Canada and the United States, and also was formerly common in countries where ore concentrates are significant, but has been superseded by the much more energy efficient process of smelting. The modern smelter typically uses a blast furnace to lower the ore concentrate to a green lixiviant, and either a blast furnace or a cupola furnace to separate out the desired metal and slag for further refinement, and uses a high-temperature, high-pressure combustion process. The smelter's furnaces are heated by smelting (directly, or indirectly through a blast furnace[1]) and reducing (heating the ore concentrate to produce a molten state with a lower melting point, a technique already used since Classical Antiquity) mixtures of coal and high-nitrogen content carboniferous rock. This is efficient in generating heat. These blast furnaces have a mass-specific power output of around 44 MJ kg−1, far more energy-efficient than the stationary furnaces of the pre-industrial era (mass-specific electrical power outputs varying between 3 W kg−1

and 30 W kg−1, or about 100 times that of a blast furnace). Smelting remained the technique for extracting copper from European ores until the Industrial Revolution, even though metal discovery increased in the 1700s. Iron pollution limited the area of operation for smelting, and by 1800, the British smelting industry had been supplanted by steam power for both blast and cupola smelters. In the late 1800s, copper smelters began replacing their blast furnaces with cupola furnaces, since the blast furnaces did not use the high-temperature and high-pressure processes required to extract valuable components from the ore, and according to IUPAC the cupola is a member of the blast furnace family, and is a type of smelting process used to convert solid ore to molten metals as well as slags. Prior to the early 1900s, cupola furnaces used coke to cook the lixiviate. With the development of the electric arc furnace (1910–1950s), metallic smelters adopted these furnaces. Cupolas are capable of reducing the ore concentrate at much lower temperatures than blast furnaces, such as the
