Elements is a free image-editing program intended for artists and for people who are prepared to pay more for this kind of highly-advanced program. Like Photoshop, it too has a layered editing system with many tools to create, alter, and save photos. Other graphic-editing programs that have a layer-based editing system include Adobe Lightroom, Picture Tools, and Corel Paint Shop Pro. Where Photoshop Dominates Photoshop dominates the market with more than 200 million users and over 80% of all desktop image-editing programs for professionals. There are also more than 50 other programs for general use, which Photoshop has replaced in some ways. In other ways, however, Photoshop's competitors have made inroads, especially with the launch of a new version, Photoshop CS2, which was almost a year late. Adobe Photoshop is by far the most popular software for image editing. (Image credit: Adobe Systems, Inc.) Some of Photoshop's main competitors are now listed below. That's why we decided to share with you the following list of 35 Photoshop Elements features you should know about. These features are quite useful and can significantly improve your photo editing! 1. Adjust Color Levels The different color levels that Photoshop Elements offers are RGB, CMYK, HSL, and LAB. RGB levels are composed of red, green and blue light in each pixel of an image. While RGB levels can be very accurate, they are not as powerful as the others. CMYK levels are compositions of cyan, magenta, yellow and black. These colors are often used to define the colors in an image. HSL levels are also known as the color wheel. They include Hue, Saturation and Lightness. With HSL you can create much more powerful color adjustments than when using RGB levels. Lab levels are composed of cyan, magenta, yellow, and blue. They are the most powerful levels in Photoshop Elements. You can use them to get precise color levels if needed. 2. Adjust Color Levels Using the Photo Filters Have you ever wanted to create a photo filter that is almost impossible to create using the Channel Mixer? Now you have the opportunity to do it with filters in Photoshop Elements! The filter selector includes filters in different categories: Auto, Adjust, Adjust Color, Adjust Lighting, Adjust Noise, and Adjust Sharpness. With the Auto option, you will adjust the levels based on the histogram or the channel mixer. You can adjust the brightness, contrast, hue, saturation and white balance. You can also customize the levels using color sliders. In the Adjust Color panel, you will find many color adjustments, including the RGB levels or the Lab levels, as well as a hue-saturation slider. In the Adjust Lighting panel, you will find the adjustments for shadows, highlights, and midtones. As usual, you will be able to adjust the brightness and contrast, the whites, and blacks. The hue can also be adjusted with the hue slider. In the Adjust Noise panel, you will find the adjustments for clarity and grain reduction. You can adjust the image sharpness. Lastly, in the Adjust Sharpness panel you will find a slider for Vignette or Lens Blur. 3. Correct Object Blur Photoshop Elements offers a blur tool that is very useful. As the health impacts of pollution and the pollution's effects on the food and water we eat are clearly being driven by increases in human population, it is equally clear that this level of pollution will never be sustainable in a world where billions of people are starving. The simple truth is that unless we find a way to reduce humanity's population, the world is doomed to a 'Spinal Tap'-style end to the century. Tipping points are supposed to be "the points in a system's evolution or collapse at which a relatively small change in the system's energy or matter content can produce a relatively large response", but the paradox is that if the average number of people in the world is decreased a lot (ditto for livestock), the amount of pollution per unit of land will decrease. The argument is that going from 7 to 4 billion, rather than 2 billion, would not be enough to drive a wave of chemicals into the biosphere, but it would represent a major change in the basis on which the world is run. The US alone now has more people than did the whole of Europe in the 18th century. The question is: Is humanity now on a tipping point? Sadly, we're not yet at the point of saying "I'm the emperor, now get off my lawn", but the climate in the short term is the next best thing. As the chemical pollution in the environment is a major factor in climate change, we know that concentrations of atmospheric carbon dioxide continue to climb, and the recent slowdown in its rise is largely thanks to the downturn in global economies. Now, a new study by researchers at the Lawrence Berkeley National Laboratory – John Stansbury and Alison Wong – suggests that increasing efforts by governments and businesses to reduce greenhouse gas emissions may not be enough to avert a future of heightened droughts, heatwaves, storms and floods. That is because the point at which the likely warming of the planet would become comparable to the warming caused by anthropogenic greenhouse gas emissions (ie. carbon dioxide) may be reached before that might have any impact on current climate patterns. It is therefore possible that no meaningful action will be taken before it is too late. In contrast, if we keep on emitting greenhouse gases in the same way, it is possible that the point at which most future impacts occur will be reached sooner. But the possibility that action might make a difference in the outcome is quite remote. What was once a fringe idea – of tipping points that were
