AutoCAD is available for use in both 2D and 3D modeling, with 2D being the most common usage. AutoCAD is not a layout tool but a drafting tool; it can be used for almost any purpose where the design engineer or draftsman draws graphical shapes or paths on the screen. Many design engineers and draftsmen use Autodesk AutoCAD software for various purposes including: Drawing technical design documents such as product sheets, use and part specifications, and assembly and fabrication drawings. Producing architectural design drawings and project blueprints for buildings, vehicles, and other facilities. Creating architectural design drawings and project blueprints for buildings, vehicles, and other facilities. AutoCAD is used to create 2D and 3D drafting, design, technical, and project documentation. The 2D and 3D modeling functionality is complemented by support for 2D CAD, fabrication, graphics, and animation. Basic features Autodesk AutoCAD software includes the following basic tools: Object-modeling: Ability to create and manipulate objects, called "blocks" or "objects". The objects can have geometric properties and a number of attributes. The objects can be grouped into blocksets, which allow them

Category:CAD softwareQ: C# WPF timer with foreach I'm trying to create a WPF application with a simple timer. The idea is to have the timer start at 0 and then countdown. The timer can be started/ended through button clicks on a GUI. When the timer gets to 0, it will write the total time it has been running to a text box on the GUI. My problem is that I want to do this through a foreach loop so I can count down the time for each item in a list. I'm assuming I need to have a foreach loop that is called by the timer and then set up a method that is called when the timer gets to 0, but I'm not sure how to make this work. I've seen several similar questions on Stack Overflow, but nothing that seems to address the specific problem I'm having. Thank you. A: You will probably want to keep a reference to your Items in a list and then iterate through it when it's time to update the text box.

```
var myList = new List();
myList.Add(new YourClass { TotalTime = 5 });
myList.Add(new YourClass { TotalTime = 5 });
myList.Add(new YourClass { TotalTime = 5 });
myList.Add(new YourClass { TotalTime = 5 });
//...add items to list... //...and then when your
timer goes to 0 foreach (var item in myList) {
    item.TotalTime -= 1; }
```

Q: How to access a global variable inside a callback function I've got a global array, which is only created once.

Now I want to use it inside a function, that should be called after it's created. This is what

```
I'm doing now: function myFunction() {
