AutoCAD is the most popular CAD application in the world, with more than 30 million users worldwide. [1] It is frequently used in the architecture, engineering and construction (AEC) industries for the design and preparation of technical drawings, and by 2D and 3D CAD software manufacturers for their own CAD applications. AutoCAD's success has also helped to ensure that Windows is the dominant operating system for personal computers. Comparisons to other CAD software and to other application categories. The following table shows some key metrics for AutoCAD and some other CAD and drafting applications in the same category. AutoCAD Apps This section includes data on the software version and number of monthly active users. It also includes information on the number of years since the original release date and the number of versions that have been released.

AutoCAD

Google Cloud Platform has AutoCAD integration and collaboration tools, which includes ArcGIS Engine and ArcGIS APIs. It has also been used to develop part of Autodesk's Interactive 3D Warehouse, which is part of ArcGIS Pro, also developed by Autodesk. In 2008 the Autodesk Professional Services team developed an application to support automotive designers. The product combined different design tools and was capable of running AutoCAD files as it contained different code for various aspects of design engineering. The product is still available but is no longer actively developed. AutoCAD is the preferred CAD software among many classes of users, notably for architectural design. AutoCAD has been mentioned as being one of the most installed CAD software on the market and as the world's most widely used CAD software by analyst company Gartner. Architectural design AutoCAD can be used for architectural and civil engineering design by architectural and engineering firms, and has a

large base of users in this market. Its wide scope has been used for a number of projects, including the Sydney Opera House and the Burj Khalifa, both in the UAE. AutoCAD was also used for the design of the Cathedral of Our Lady of the Angels in Los Angeles. The construction and engineering firm Jacobs Engineering also used Autodesk for the design of the Marriott Marquis and MGM Grand in Las Vegas. AutoCAD's ability to import, view, and extract metadata from DWG files has made it popular for use in documenting the construction of new buildings, and for architectural firms documenting the design of existing buildings. The ability to be embedded in construction documents in other applications such as eDrawings have also increased its popularity in this market. Part of the strength in the architectural design market is in its ability to perform interoperability with other software and hardware systems that are used in the design process. In architectural design, users have generally adopted a rule based design approach using GIS and CAD software. A small number of the Autodesk Design Suite applications also have GIS capabilities such as Geomagic Design Automation which is used for drafting topographic views of buildings. The design process

When architecture is undertaken for a new building, the design process typically takes about seven months to plan and design the building. There are three main steps in the design process. The first is conceptual design and architecture, which involves planning the form, function, and the architectural and engineering design details of the building. af5dca3d97
