I don't fully understand why, but I always see IMUs like the one in the image linked below simply determining the attitude of the IMU/structure using quaternions with no additional sensors like optical gyroscopes, accelerometers, magnetometers, etc. My reasoning is that the gyroscopes are already sensing rotation, and if the IMU is rotating as well, then the attitude of the IMU should be determined by the combination of gyroscopes and accelerometers. My main question is: where do all the optical gyroscopes, accelerometers, magnetometers and pressure sensors come into play in these cases? A: I've listed a fairly complete list of INS and IMU sensors in an answer to a question here. According to this article (emphasis added): 3. Sensor Fusion. Many high-performance instruments make use of the International Reference System, or IRS, which establishes definitions for three reference coordinate systems: Earth-Centered Earth-Fixed (ECEF), Earth-Centered Earth-Aligned (ECEA), and the Earth-Centered Earth-Fixed Aligned (ECEF FA). So with their IREF-compliant sensors, you could get very accurate results from your "end-user" inertial measurement applications. Since this is basically the same technology on which GPS systems run, you can even avoid using the external GPS receiver. Q: Throwing exceptions from native c++ to Java I'm trying to use some library from Java. So I have a function in C++ code which I want to call from Java but it is not allowed to. So I want to convert my function to throw exception to Java. I was able to throw exception and then catching it in Java code. But if I want to call a function in Java (which throws exception) from C++, it 6d1f23a050
