Q: What is the difference between `using` and `using static` in method call? I'm getting familiar with the notion of this in dynamic languages, but I have not yet got its meaning in C#. I will give an example: using static System.Console; class Program { static void Main() { DoSomething(Console.WriteLine); } static void DoSomething(Action action) { action(); } } It is clear that DoSomething is not a type which takes a delegate to its argument. But it seems to me that such an argument is understood by the compiler in the same way as int, string or any other type. But what happens if we call DoSomething like this: using static System.Console; class Program { static void Main() { DoSomething(Console.WriteLine); } static void DoSomething(Action action) { action(); } } Is the compiler unable to figure out what method we call? Do we need to get into some overhead to "clear" the local variable, and what? A: The second call to DoSomething() is not a call to the 'static' version of DoSomething(). In fact, you are calling the non-static version of DoSomething() which accepts a delegate and expects a parameter. That is what is confusing the compiler. If you were to call the 'static' version of DoSomething() like so: DoSomething(DoSomething); then the compiler would know what version of DoSomething() you are calling. I'm going to assume that DoSomething() is a public method of Program class, so you could also call it as: DoSomething(() => Console.WriteLine()); It's now been close to a year since the world lost one c6a93da74d
